

Teknek Academy widens its reach to OEM partners

The Teknek Academy, launched back in 2010, has been successfully producing qualified clean machine technicians for several years. The completion of this module forms part of our comprehensive training programme that is undertaken by all our key distribution partners. It provides the student with the ability to carry out an informed scientific conversation with the customer and then clearly demonstrate the benefits of the Teknek products.

The Teknek Web Cleaner (TWC) product provided another challenge to the Teknek training team. The TWC is aimed at equipment manufacturers (OEM's) working in the high end optical film and battery coating sector. It was going to be a big challenge to bring all the customer facing teams to the UK, so a new solution was required. If they cannot get to the training in the UK, then the training will go to them! A new training programme was commissioned earlier in the year to allow this to happen.

Working with our qualified converting distributor, JK Innotion, Teknek is now rolling out this new module. The first phase being delivered is a set off tailored training seminars that are now taking place in Korea. Supported by Teknek staff, JK Innotion are delivering this course at their training suite and at the OEM's own facility throughout this week.

This event presented a great opportunity to introduce the innovative "Low Static Cleaning Technology", or NT™ Technology, to the Korea converting sector. More training seminars will be organised throughout 2019 explaining NT™ and other new technology's coming from the Teknek research team.

For more information on the Teknek Academy or NT Technology, please contact Teknek at www.teknek.com
